

**ABSTRACT**

There is provided a slot-in type reproducing/recording apparatus in which a plurality of different sized disks are applicable and a disk surface is protected from dust and dirt caused by disk insertion and ejection. The slot-in type reproducing/recording apparatus includes an apparatus body (1) having a slot (1A) for inserting and ejecting a disk (D) and a hold assembly (5) provided inside the apparatus body (1) for accommodating the disk (D). Since the hold assembly (5) has three arms (52 to 54) that respectively press an outer circumferential edge of the disk (D) at different points with the predetermined biasing force, two types, i.e., a small type and a large type, of disk (D) can be held with the biasing force without the arms (52 to 54) touching the surface of the disk (D).
